

Product brief

01 OCT 2026 | VERSION 1.0

The idea

Harbour AI is a fictional support copilot for small online shops. It searches approved help articles and order information, then drafts a reply with links to its evidence. This demo scenario is invented; its numbers are not results from AskBase or Saumya's work.

What the copilot can do

Harbour AI can explain delivery timelines, find an order status, and draft a response about an existing refund policy. It can read order information through a tool. A support agent must approve every outgoing reply. The copilot cannot send messages, issue refunds, change addresses, or cancel orders by itself.

Pilot goals

The Harbour AI pilot aims to reduce median handling time by at least 40%, reach at least 95% citation correctness, and keep unsupported answers below 2%. All three targets must be met before unattended sending is considered. The pilot results report records actual measurements; these goals are targets, not outcomes.

Launch scope and budget

Harbour AI will first offer an English-only, human-reviewed beta for 10 shops. Arabic support, voice support, and unattended sending are outside this beta. The proposed monthly price is AED 299 per shop, including 1,000 draft replies. At 10 paying shops, the proposed monthly subscription revenue would be AED 2,990 before costs. Pilot participants are not yet paying customers.

Open decisions

The team still needs to choose an Arabic evaluation set and decide how to handle stale help articles. No public launch date or annual revenue forecast has been approved. Read the Harbour AI pilot report for the release decision and the safety policy for required controls.
